Uhzmi Games - Game Portal PRD

1. Company Details

Field	Value
Company Name	Uhzmi Games
Company Type	Independent game studio and digital entertainment publisher
Industry	Gaming
Location	Bangalore, India
Contact Email	hello@uhzmigames.com

2. Project Title

Uhzmi Games Portal: A Locally Hosted Browser Game Website with Admin Panel

This project is a locally runnable single-page game portal website. The site lets visitors browse, search and play free HTML5 games instantly with no login required. All game data lives in local JSON files and the site runs fully offline on localhost. A minimal admin panel lets the owner add, edit or delete games through a simple form. The freelancer will source and integrate 12 free-license itch.io games so the portal is fully populated from day one.

3. Project Overview

The portal is a dark-themed single-page application built with React and Vite. It reads all game data from a local `games.json` file served by a tiny Node.js Express backend. Visitors land on a homepage showing game cards organized by category rows plus a Top 5 Most Played section. Each game card features a hover zoom effect with a play button overlay. Clicking a card opens a dedicated game page where the game loads inside an iframe. Users can search games by title, browse by category through a left sidebar, and sort by popularity, recency or alphabetical order. The site has no user accounts, no database, and no internet dependency once the initial `npm install` is done.

The entire portal runs on `localhost` through a single `npm run dev` command. All game files, covers, JSON data, and the admin panel are self-contained within the project folder. Adding a new game means dropping a game folder, a cover image, and one JSON entry: no code changes needed.

4. Technology Stack

Layer	Technology
Frontend Framework	React 18 with Vite
Local Backend	Node.js + Express (minimal, admin panel only)
Data Storage	Local JSON files (games.json, categories.json, sounds.json)
Styling	Tailwind CSS
Animated Background	reactbits.dev: DotField component
Animated Logo	reactbits.dev: AsciiText component
Game Embedding	HTML iframe from local /games/ folder
Package Manager	npm
Font	Inter (Google Fonts, free and open source)
Icons	Lucide React (free and open source)
Sounds	Free CC0/CC-BY audio from Freesound.org or Mixkit.co

5. Requirements

5.1 Site Layout, Navigation and Features

5.1.1 Overall Page Structure

The site has four persistent regions:

1. **Top Header:** sticky, stays pinned while content scrolls underneath. Contains the animated AsciiText "Uhzmi Games" logo on the left, primary navigation links (Games, Categories, New, Popular) in the center, a search bar on the right, and a toggle button for background music on the far right.
2. **Left Sidebar:** a vertical list of all twelve game categories with small icons. The active category is highlighted in the accent color. On mobile, this sidebar collapses into a hamburger menu that slides in from the left.
3. **Main Content Area:** scrollable region containing the DotField animated background with game content overlaid on top. Organized into horizontal sections.
4. **Footer:** multi-column layout with links to About, FAQ, Terms of Use, Privacy Policy, Contact, and a copyright line. Footer content is specified in section 5.1.10.

5.1.2 Homepage Sections (in order, top to bottom)

1. **Top 5 Most Played Games:** a horizontal featured row showing the five games with the highest `playCount`. Each card is slightly larger than standard cards. This row uses a carousel with left and right arrow buttons that appear on hover.
2. **Category Rows:** one row per category from the categories.json list. Each row has a bold heading and a "See all ->" link that routes to the full category page. Each row is a horizontal carousel. Arrows appear on row-hover and scroll the row; arrows hide at the start and end extents. Rows that have zero games in that category are hidden.
3. **All Games Section:** below the category rows, a "Browse All Games" heading followed by a static wrapped grid showing every game on the site. Cards are sorted by newest first by default.

5.1.3 Game Card Design

- Rounded-corner rectangle with a 16:9 cover image filling most of the card
- Game title below the thumbnail in white Inter font, weight 600
- Optional corner badge ribbon: "New", "HOT", or "Top Rated" in accent colors
- A metadata row below the title showing star rating and play count

5.1.4 Game Card Hover States

On mouse hover, the card must do all of the following simultaneously with a 200ms `ease-in-out` transition:

1. Scale up to `transform: scale(1.05)` so the card pops above its neighbors

2. Elevated drop shadow via `box-shadow` growing
3. Z-index raised so the zoomed card overlaps adjacent cards instead of being clipped
4. A dark semi-transparent gradient overlay fades in over the thumbnail
5. A centered white play icon (triangle) appears on top of the overlay
6. Title text brightens or shifts to the accent color
7. On mouse-leave, everything smoothly reverses over the same 200ms duration with no instant snap

On mobile and touch devices, hover effects are disabled. Tapping navigates directly to the game page.

5.1.5 Category Pages

Accessible from the left sidebar or the "See all ->" link on each homepage row.

- Full-width grid of game cards filtered to that category
- Sort and filter controls at the top with the following options:
 - **Most Popular:** sorted by playCount descending
 - **Newest First:** sorted by addedDate descending
 - **Oldest First:** sorted by addedDate ascending
 - **A to Z:** sorted alphabetically by title ascending
 - **Z to A:** sorted alphabetically by title descending
- Tag filter: clicking a tag shows all games with that tag within the current category
- Infinite scroll or a "Load More" button as the user scrolls down

5.1.6 Search

- Search bar in the header with a magnifying glass icon
- Live autocomplete dropdown as the user types (debounced 250ms)
- Matching game titles appear with small thumbnail images
- Enter or clicking a suggestion navigates to the game page or search results page
- Arrow keys move through suggestions, Esc closes the dropdown, clicking outside closes it

5.1.7 Game Play Page

Accessible by clicking any game card. URL pattern: `/games/[slug]`

- Large central game viewport with a loading spinner while the game boots
- Click-to-play splash overlay before the game loads (click to start)
- Player toolbar: Fullscreen toggle (uses browser Fullscreen API), report button
- Below the viewport: game title, developer or author name, short description, and controls or instructions
- Related games grid below with 6 to 8 similar games pulled from the same category and tags
- Breadcrumb trail: Home > Category Name > Game Title
- No rating widget, no comments, no favorites (no user accounts exist)

5.1.8 Top 5 Most Played Logic

The `playCount` field in `games.json` increments by 1 on the local Node.js server every time a user clicks to start a game. On homepage load, the frontend reads the top 5 games sorted by `playCount` descending and displays them in the featured carousel. Since the site runs locally, counts persist as long as `games.json` is not reset.

5.1.9 JSON Data Files

The freelancer must create and include these files in `src/data/`. All content below is final and must be used as-is.

categories.json

```
[
  { "id": "action",      "label": "Action",      "icon": "icon-action.svg" },
  { "id": "racing",     "label": "Racing",     "icon": "icon-racing.svg" },
  { "id": "adventure",  "label": "Adventure",  "icon": "icon-adventure.svg" },
  { "id": "puzzle",     "label": "Puzzle",     "icon": "icon-puzzle.svg" },
  { "id": "sports",     "label": "Sports",     "icon": "icon-sports.svg" },
  { "id": "arcade",     "label": "Arcade",     "icon": "icon-arcade.svg" },
  { "id": "shooting",   "label": "Shooting",   "icon": "icon-shooting.svg" },
  { "id": "strategy",   "label": "Strategy",   "icon": "icon-strategy.svg" },
  { "id": "simulation", "label": "Simulation", "icon": "icon-simulation.svg" },
  { "id": "board",      "label": "Board Games", "icon": "icon-board.svg" },
  { "id": "music",      "label": "Music",      "icon": "icon-music.svg" },
  { "id": "educational", "label": "Educational", "icon": "icon-educational.svg" }
]
```

games.json: The freelancer must populate this with 12 entries using free-license HTML5 games sourced from itch.io. Each game must have a license that explicitly allows self-hosting (MIT, GPL, CC0, or free to use). The structure for each entry is:

```
{
  "id": 1,
  "title": "Shadow Strike 3D",
  "slug": "shadow-strike-3d",
  "cover": "covers/shadow-strike-3d.jpg",
  "category": "action",
  "tags": ["shooting", "3d", "fps"],
  "description": "Infiltrate enemy bases and take down targets with precision in this fast-paced 3D shooter.",
  "controls": "WASD to move, mouse to aim, left-click to shoot, R to reload.",
  "gameUrl": "games/shadow-strike-3d/index.html",
  "badge": "HOT",
  "author": "StrikeDev Studios",
  "source": "itch.io",
  "license": "MIT",
  "addedDate": "2026-06-13",
  "playCount": 0
}
```

The 12 game entries are listed in section 5.7. The freelancer must populate `games.json` with all 12 entries, adapting the actual game details (title, description, controls, source URL, license) from the itch.io pages they download from.

sounds.json

```
{
  "cardClick": "sounds/click.mp3",
  "backgroundMusic": "sounds/bgm.mp3",
  "enabled": false
}
```

The freelancer sources these two MP3 files from Freesound.org or Mixkit.co under CC0 or free license.

5.1.10 Footer Content

The footer must display the following text exactly. The freelancer must create static pages or modal overlays for each link. The content for each page is provided below and must not be modified.

Footer Links (displayed in 5 columns on desktop, stacked on mobile):

Column	Link Text	Target
1	About	Opens About section
2	FAQ	Opens FAQ section
3	Terms of Use	Opens Terms section
4	Privacy Policy	Opens Privacy section
5	Contact	Opens Contact section

Copyright line (below the columns): "(c) 2026 Uhzmi Games. All rights reserved."

About Content:

```
Uhzmi Games is an independent game studio founded in 2024, based in Bangalore, India. We curate and publish browser-based games for entertainment purposes. Our mission is to provide a diverse collection of high-quality, free-to-play games that can be enjoyed directly in your web browser without the need for downloads or installations. We focus on a variety of genres, including puzzle, strategy, and action games, ensuring there's something for everyone. All games are sourced from trusted developers and are completely free of malware and unwanted ads. We are committed to providing a safe and enjoyable gaming experience for all our users. For more information about our studio and the games we offer, please visit our About page.
```

FAQ Content:

```
Q: Do I need to install anything to play?  
A: No. All games run directly in your browser. Just click a game card and start playing.  
  
Q: What browser works best?  
A: Chrome, Firefox, Edge, and Safari all work fine. Keep your browser updated for the best experience.  
  
Q: Can I play on mobile?  
A: Yes. The site is fully responsive and works on phones and tablets. Some games may play better with a keyboard on desktop.  
  
Q: Are these games safe?  
A: Yes. All games are free of malware and run in a sandboxed browser environment. We source games from trusted platforms.  
  
Q: Can I submit my own game?  
A: This portal is locally hosted. If you have the project files, you can add your game by following the instructions in the FAQ section.
```

Terms of Use Content:

```
By using the Uhzmi Games portal, you agree to the following terms:  
  
1. All games are provided "as is" for entertainment purposes only. Uhzmi Games makes no guarantees about game availability or performance.  
2. Games hosted on this portal are sourced under open licenses (MIT, GPL, CC0, or free-to-use). If you are a game developer, please contact us for more details.  
3. You may not attempt to modify, reverse engineer, or redistribute the games or the portal software without explicit permission.  
4. Uhzmi Games is not responsible for any damages or losses resulting from the use of this portal.  
5. These terms may be updated at any time. Continued use of the portal after changes means you accept the new terms.
```

Privacy Policy Content:

```
Last updated: June 2026

This portal runs entirely on your local machine. It does not collect, store, or transmit any personal data.

What we do NOT collect:
- No names, email addresses, or account information (there are no user accounts)
- No IP addresses or location data (the site runs offline on localhost)
- No browsing history or game play data (play counts are stored only in a local JSON file on your machine)
- No cookies (the site only uses localStorage for the background music toggle preference, which never leaves your browser)

Third-party services:
- Google Fonts (Inter font) is loaded from Google's CDN when the site first loads. Google may log the font request as per their policy.
- reactbits.dev components are installed locally via npm and do not make external requests at runtime.

If you have questions about privacy, contact hello@uhzmigames.com.
```

Contact Content:

```
Email: hello@uhzmigames.com
Location: Bangalore, India
Response time: We aim to reply within 2 business days.

For game submissions, licensing inquiries, or general questions, send us an email. Since this portal is locally hosted,
```

5.2 UI Style and Visual Design

5.2.1 Color Palette

The freelancer must use these exact hex color values throughout the entire site:

Usage	Hex Code	Description
Page Background	#0A0E1A	Dark navy, the main background behind the DotField animation
Card Background	#141829	Slightly lighter than page background, used for game cards, sidebar, and content panels
Primary Text	#FFFFFF	White, used for all headings and main text
Secondary Text	#8892B0	Muted grey-blue, used for metadata, descriptions, and footer text
Accent Color	#7C3AED	Violet-purple, used for the logo hover, active nav links, button backgrounds, card hover title color, and the play icon overlay
Badge: HOT	#EF4444	Red badge ribbon
Badge: New	#22C55E	Green badge ribbon
Badge: Top Rated	#F59E0B	Gold or amber badge ribbon
Overlay Gradient	rgba(0, 0, 0, 0.55)	Dark overlay that fades in on card hover

5.2.2 Typography

The freelancer must use **Inter** from Google Fonts (free and open source) for all text on the site.

Element	Weight	Size
Site logo (AsciiText)	N/A	Large display
Section headings	700 (Bold)	24px
Card titles	600 (SemiBold)	16px
Body text and descriptions	400 (Regular)	14px
Metadata (play count, rating)	400 (Regular)	12px
Nav links	500 (Medium)	14px

5.2.3 Animated Background: DotField

The entire page background behind the game content must use the **DotField** animated background from reactbits.dev. This creates a field of dots that move gently and respond to mouse position.

Installation command:

```
npm install @reactbits/dotfield
```

The DotField component must be placed as the background layer behind all page content. It should be fixed position covering the full viewport. All game cards, the sidebar, and text content sit on top of it with appropriate backgrounds or semi-transparent panels so content remains readable.

5.2.4 Animated Logo: AsciiText

The "Uhzmi Games" logo text in the header must use the **AsciiText** component from reactbits.dev. It renders the company name as animated ASCII-style characters.

Installation command:

```
npm install @reactbits/asciitext
```

The AsciiText component replaces the static logo in the header. It should render "UHZMI GAMES" in white or the accent color against the dark header background.

5.2.5 Button and Interaction States

The freelancer must ensure these interaction states exist for every interactive element:

- **Buttons (hover):** Background shifts to accent color or brightens, text inverts to white, 150ms ease transition
- **Buttons (active or press):** Slight scale-down to 0.97 or 0.98, opacity dip of 0.9, 100ms transition
- **Buttons (focus):** Visible focus ring using the accent color with 2px outline-offset, required for keyboard accessibility
- **Nav links (hover):** Text color shifts to the accent color, 150ms ease
- **Sidebar category items (hover):** Background shifts to #1E2640, slight padding or indent change, 150ms ease
- **Sidebar category items (active):** Accent color left border or full background highlight
- **Game cards:** Full hover behavior as described in section 5.1.4
- **Search input (focus):** Border color shifts to accent color, subtle glow

5.3 Folder Structure

The freelancer must deliver the project with this exact folder structure. No deviations.

```

uhzmi-games/
├── public/

├── vite.config.js
├── README.md
└── .gitignore

```

5.4 Sound and Audio

The site must include two audio features using free license sounds:

1. **Card Click Sound:** a short click or pop sound effect that plays when the user clicks any game card. Must be approximately 0.1 to 0.3 seconds long and non-intrusive. Source from [Freesound.org](https://www.freesound.org/) under CC0 license.
2. **Background Music:** a looping ambient or light electronic track that plays softly while the user browses. The header must include a toggle button (speaker icon) to turn the background music on and off. The toggle state persists in `localStorage` so the user preference is remembered between visits. Default state is off. Source from [Mixkit.co](https://www.mixkit.co/) under free license.

The sounds must be placed in `public/sounds/` as `click.mp3` and `bgm.mp3`. The `sounds.json` file maps these filenames to the code.

5.5 Licenses and Resources

The README.md must include a "Licenses and Resources" section listing:

- Each of the 12 games with the game title, source URL on itch.io, and the license type (MIT, GPL, CC0, or free to use)
- The cover image source for each game (the itch.io game page URL)
- Sound sources: the Freesound.org or Mixkit.co URL for click.mp3 and bgm.mp3 with their CC0 or free license attribution
- The Inter font: Google Fonts, SIL Open Font License
- ReactBits components: DotField and AsciiText, both from reactbits.dev
- Lucide React icons: ISC License

5.6 How to Add Games: Admin Panel and Manual Method

The site supports two ways to add games. Both methods are required deliverables.

5.6.1 Method A: Admin Panel (the easy way)

The freelancer must build a minimal admin panel at the `/admin` URL. This is a local-only page (no login, no authentication) that gives the owner a simple way to manage games without touching code.

The admin panel must have three functions:

Add a Game

A form with these fields. Submitting writes a new entry to `games.json`:

Field	Input Type	Notes
Title	Text input	The slug auto-generates from the title as you type and shows below the field as a preview
Category	Dropdown	Pulls options from <code>categories.json</code>
Tags	Text input	Comma separated, e.g. "shooting, 3d, fps"
Description	Textarea	1 to 2 sentences shown on the game page
Controls	Text input	e.g. "WASD to move, mouse to aim"
Author	Text input	Developer or studio name
Source	Text input	e.g. "itch.io" or "self-made"
License	Text input	e.g. "MIT" or "CC0"
Badge	Dropdown	Options: None, New, HOT, Top Rated
Game folder path	Text input	The slug name of the folder already placed in <code>/games/</code>
Cover image path	Text input	The slug name of the cover already placed in <code>/public/covers/</code>

On submit, the form writes the new entry to `games.json` via the Express server. The new card appears on the site immediately on next page load.

Edit a Game

A table listing all current games with an Edit button for each. Clicking Edit opens the same form pre-filled with that game's data. Submitting updates that entry in `games.json`.

Delete a Game

A Delete button next to each game in the table. Clicking it removes the entry from `games.json`. This does not delete the actual game folder or cover image from disk: it only removes the card from the site.

Admin Panel Technical Requirements:

- Runs at `/admin` on localhost only
- The form submits via POST to the Express server in `server.js`
- The Express server reads and writes `games.json` on the local file system

- No authentication required since it is localhost only
- The form UI does not need to be fancy. Functional UI is sufficient

5.6.2 Method B: Manual Code Editing (for advanced users)

For users comfortable editing JSON directly, games can also be added by hand. This method is the fallback if the admin panel is not working or if batch adding multiple games at once.

Steps to add a game manually:

1. Drop the game folder into `/games/[slug]/` with `index.html` at the root
2. Drop the cover image into `/public/covers/[slug].jpg` (640x360, 16:9, JPG)
3. Open `src/data/games.json`
4. Add a new JSON object following the schema from section 5.1.9. Copy the structure of an existing entry and replace the values
5. Save the file and refresh the site

The freelancer must document both methods (Method A and Method B) in detail inside the README.md under a section called "Adding a New Game". The README must include the exact JSON schema, field descriptions, folder naming rules, and common troubleshooting tips.

5.7 Game Entries for games.json

The freelancer must populate `games.json` with 12 real HTML5 games sourced from itch.io. Each game must be free to download and carry a license that allows self-hosting (MIT, GPL, CC0, or free to use). The game must run fully in a browser from its own `index.html` with no external server dependency.

The freelancer must find and integrate games matching these specifications:

1. **Action** (1 game): an FPS or shooting game
2. **Racing** (1 game): a drifting or kart racing game
3. **Adventure** (1 game): a dungeon crawler or maze escape game
4. **Puzzle** (1 game): a block, tile or word puzzle game
5. **Sports** (1 game): a football or soccer game with local multiplayer
6. **Arcade** (1 game): a space shooter or brick breaker game
7. **Shooting** (1 game): a sniper or target shooting game
8. **Strategy** (1 game): a tower defense or turn-based strategy game
9. **Simulation** (1 game): a city builder or management simulation game
10. **Board Games** (1 game): chess, checkers or any board-based game
11. **Music** (1 game): a rhythm or music creation game
12. **Educational** (1 game): a math, typing or learning game

For each game, the freelancer must:

- Download the game zip from itch.io
- Rename the folder to the game's slug (lowercase, hyphens only)
- Place it in `/games/[slug]/` with `index.html` at the root
- Source the cover image from the game's itch.io page
- Resize or crop the cover to 640x360 pixels (16:9), save as JPG
- Place the cover in `/public/covers/[slug].jpg`
- Create the corresponding entry in `games.json` with all fields filled
- Document the source URL and license in the README

If any of the above game types are unavailable on itch.io, the freelancer may substitute with a functionally equivalent game in the same category that meets all license requirements. Substitutions must be approved by the project owner before integration.

5.8 Project Start Commands

The freelancer must ensure the following commands work out of the box:

```
npm install      # installs all dependencies
npm run dev      # starts the local dev server on localhost:5173
```

The Express server for the admin panel should start alongside Vite or be accessible through Vite's proxy configuration. The final setup must require only `npm install && npm run dev` with no manual server configuration.

6. Scope Boundaries

6.1 In Scope

The freelancer must deliver all of the following:

1. A fully working React + Vite website that runs with `npm run dev` on localhost
2. All pages: Homepage, Category pages, Game play page, Search results page, Admin page
3. Static footer pages: About, FAQ, Terms of Use, Privacy Policy, Contact (content provided in section 5.1.10)
4. Dark themed UI with the exact color palette specified in section 5.2.1
5. DotField animated background across the entire site
6. AsciiText animated "UHZMI GAMES" logo in the header
7. Left sidebar with all 12 categories from `categories.json`
8. Game cards with all hover effects described in section 5.1.4
9. Search bar with live autocomplete dropdown
10. Top 5 Most Played carousel on the homepage (logic in section 5.1.8)
11. Category rows with horizontal carousels and "See all" links
12. Game play page with iframe embedding from local `/games/` folder
13. Play count increment system via the local Express server
14. Category pages with sort and filter functionality including Most Popular, Newest First, Oldest First, A to Z, and Z to A sorting
15. Tag-based filtering
16. Responsive design: mobile hamburger sidebar, grid reflowing to 2 columns
17. 12 itch.io games fully integrated into `games.json`
18. Cover images for all 12 games sourced from itch.io and placed in `/public/covers/`
19. Two free license sound files sourced and integrated
20. Background music toggle with localStorage persistence
21. Card click sound effect
22. Minimal admin panel at `/admin` with Add, Edit, and Delete functionality (section 5.6.1)
23. Express server in `server.js` to handle admin form submissions writing to `games.json`
24. `dataService.js` abstraction layer for all data reads
25. Folder structure matching section 5.3 exactly
26. README.md with setup instructions, JSON schema reference, and "Adding a New Game" section covering both admin panel and manual methods
27. Licenses and resources documented in the README

6.2 Out of Scope

The freelancer must NOT include or build any of the following:

1. User accounts, registration, login, or authentication of any kind
2. A database (MySQL, PostgreSQL, Firebase, Supabase, or any other)
3. Comments, ratings, likes, favorites, or any social features
4. Push notifications, email notifications, or admin dashboard analytics
5. Video uploads or video content
6. Payment processing, subscriptions, or any monetization features

7. iOS or Android mobile app versions
8. A public production deployment or hosting setup
9. SEO metadata, sitemaps, or search engine optimization
10. Third-party ads or ad integration
11. Uploading game files through the admin panel (the admin panel edits JSON only; game files are added manually via the file system)
12. Any backend CMS, WordPress, or database-driven content management system
13. Flash or Ruffle emulation for legacy SWF games

7. Deliverables

The freelancer must deliver the following:

Deliverable	Description
<code>uhzmi-games.zip</code>	Full project folder zipped, ready to extract and run
<code>README.md</code>	Complete documentation covering setup, JSON schema, adding games (admin panel and manual), troubleshooting, and license attributions
<code>games.json</code>	Populated with all 12 game entries using the schema from section 5.1.9
<code>categories.json</code>	The 12 categories exactly as specified in section 5.1.9
<code>sounds.json</code>	Audio file mappings as specified in section 5.1.9
<code>/public/covers/</code>	12 cover images (640x360 JPG) sourced from itch.io game pages
<code>/public/sounds/</code>	2 free license MP3 sound files
<code>/games/</code>	12 game folders each containing a playable <code>index.html</code>
<code>server.js</code>	Minimal Express server for admin panel writes
Source code	All React components, pages, services, and hooks as listed in the folder structure

8. Acceptance Criteria

The project is considered complete when all of the following are true:

1. `npm install && npm run dev` starts the site on localhost with zero errors
2. All 12 game cards appear on the homepage with correct covers, titles, and category tags
3. Hovering any card triggers the full animation sequence: scale up, shadow, overlay, play icon
4. Clicking a category in the sidebar filters the grid to only that category
5. All 5 sort options work on category pages: Most Popular, Newest, Oldest, A to Z, Z to A
6. Searching for a game title shows it in the autocomplete dropdown
7. Clicking a game card opens the game page and the game loads inside the iframe
8. The play count increments and the Top 5 section reflects the most played games
9. The admin panel at `/admin` allows adding a new game entry that appears on the site
10. The admin panel allows editing an existing game entry
11. The admin panel allows deleting a game entry which removes the card from the site
12. The background music toggle works and the preference survives a page refresh
13. The card click sound plays when clicking a game card
14. The site is fully responsive and works on mobile viewport widths
15. All 5 footer links open their respective content pages or modals

16. The README contains all required sections with clear instructions
